CS492: Probabilistic Programming Generative Modelling with Anglican

Hongseok Yang KAIST

CS492: Probabilistic Programming

Generative Modelling with Anglican

Hongseok Yang KAIST

I have limited experience in modelling. Better title: Further examples in Anglican.

What is a model?

- I. A probability density or mass function.
- 2. A simulator or a sampler.

What is a model?

- I. A probability density or mass function.
- 2. A simulator or a sampler.
 - Generative view.
 - Well-supported by prob. PLs like Anglican.
 - Express how a hypothesis arises and also how it generates observed data.

Solving a problem via generative modelling

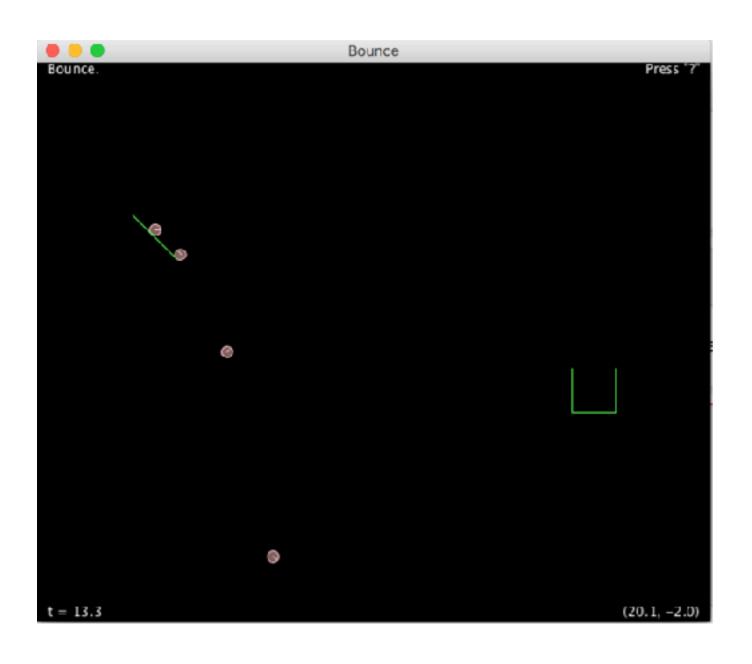

- I. Create a simulator (i.e. a generative model).
 - How do candidate solutions arise?
 - How do solutions generate observations?
- 2. Specify success criteria with conditioning.
- 3. Solve the problem by posterior inference.

Learning outcome

- I. Can use generative modelling for solving a problem.
- 2. Can reproduce the solutions of 2D physics and program induction in Anglican.
- 3. Can write interesting probabilistic programs using the expressive power of Anglican.
- 4. Can explain Poisson, Gaussian distributions.

2D physics

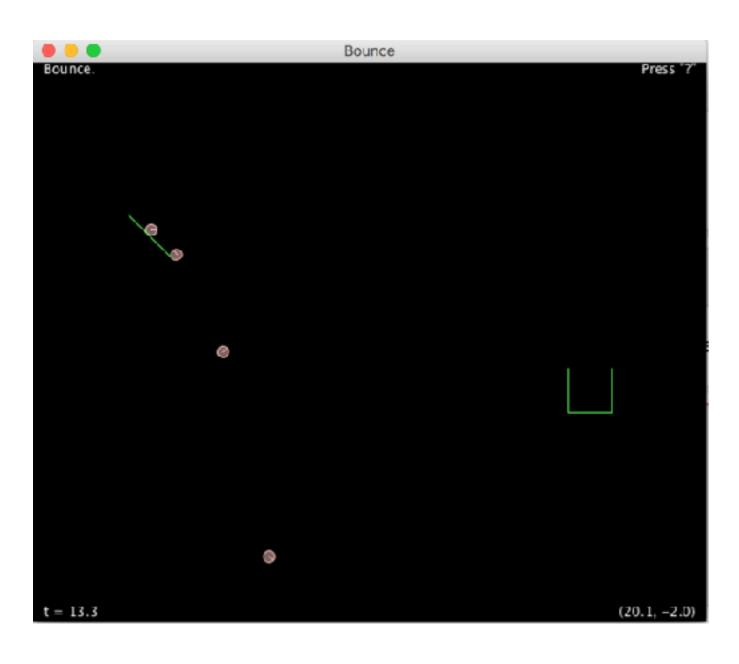

2D physics

20 balls are falling from top-left.

[Q] How to move them to the bin?

2D physics

20 balls are falling from top-left.

[Q] How to move them to the bin?

[A] Put bumpers.

How to solve this in Anglican?

I. Create a simulator.

2. Specify success criteria with conditioning.

I. Create a simulator.

2. Specify success criteria with conditioning.

- 1. Create a simulator.
 - Randomly place bumpers. Drop balls.
- 2. Specify success criteria with conditioning.

I. Create a simulator.

Randomly place bumpers. Drop balls.

2. Specify success criteria with conditioning.

- I. Create a simulator.
 - Randomly place bumpers. Drop balls.
- 2. Specify success criteria with conditioning.
 - High likelihood if many balls reach the bin.
- 3. Solve the problem by posterior inference.

- I. Create a simulator.
 - Randomly place bumpers. Drop balls.
- 2. Specify success criteria with conditioning.
 - High likelihood if many balls reach the bin.
- 3. Solve the problem by posterior inference.

Clojure functions for 2D physics in bounce.clj

I. Create a world.

```
(def bumpers (list (list -3 6) (list 2 5))
(def start-w (create-world bumpers))
```

2. Simulate 20 balls in the world.

```
(def end-w (simulate-world start-w))
```

3. Count the number of balls in the bin.

```
(def num-balls (balls-in-box end-w))
```

These functions are defined in bounce.clj available at the course webpage.

Clojure functions in Anglican programs

Clojure functions in Anglican programs

Imports primitive Clojure fns.

Clojure functions in Anglican programs

[Q] More balls in the bin. Express this goal using observe.

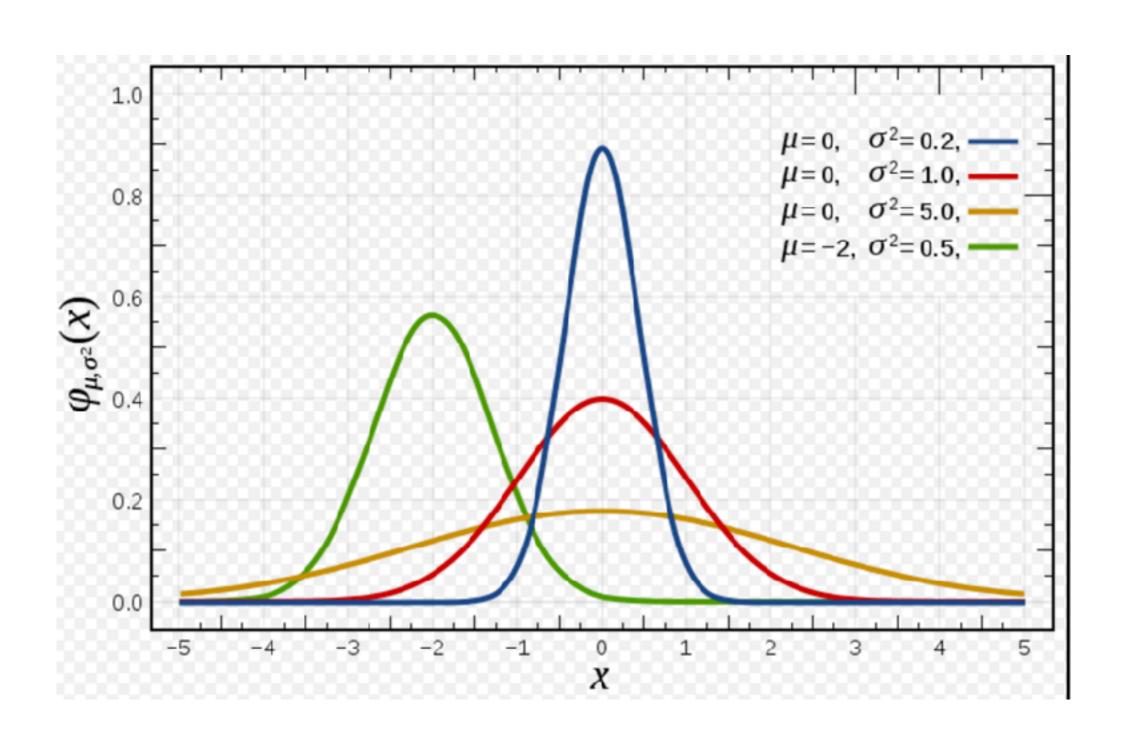

$$f(x \mid \mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

- Probability distribution on a real x.
- Specified by density f. Also by μ and σ .

$$f(x \mid \mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

- Probability distribution on a real x.
- Specified by density f. Also by μ and σ .
- [Intuition I] x is in [μ -2 σ , μ +2 σ] usually.
- [Intuition 2] The chance of x being further from µ decays exponentially.

Normal distribution

$$f(x \mid \mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

$$p(x \mid y) = \frac{p(y \mid x) \times p(x)}{p(y)}$$

 Bayes's rule holds regardless of whether p is a probability mass or a prob. density.

Baby program induction

Baby program induction

[Q] Find a Clojure function that interpolates these data points.

Borrowed from Paige, van der Meent & Wood's tutorial at PPAML16 summer school

Solve program induction via generative modelling

I. Create a simulator.

2. Specify success criteria with conditioning.

3. Solve the problem by posterior inference.

Solve program induction via generative modelling

- I. Create a simulator.
 - Generate expressions using probabilistic grammar.
- 2. Specify success criteria with conditioning.
 - High likelihood if the evaluation of a sampled expression matches data well.
- 3. Solve the problem by posterior inference.

Solve program induction via generative modelling

- 1. Create a simulator.

0.05 \quad 0.05 \quad 0.05 \quad 0.05

Num ::= -9 | -8 | ... | 9 | 10

BEx ::= (+ Ex Ex) | (- Ex Ex) | (* Ex Ex)
```

```
Prog ::= (fn [x] Ex)

0.4 \quad 0.4 \quad 0.2

Ex ::= Num | x | BinEx

0.05 \quad 0.05 \quad 0.05 \quad 0.05

Num ::= -9 | -8 | ... | 9 | 10

BEx ::= (+ Ex Ex) | (- Ex Ex) | (* Ex Ex)
```

For each nonterminal, pick a rule probabilistically.

How to represent this prob. grammar in Clojure?

Quoted expressions

- Data structure for Clojure programs.
- Roughly nested lists (and vectors) of symbols & constants.

```
(def e1 (list '* (list '+ 1 'x) '3))
(def e2 (list 'fn ['x] e1))
```

• Can be converted to a program via eval.

```
(eval e2 10), (eval e1 10)
```

(defm gen-e []

Ex: (Num, x, BinEx) — (.4, .4, .2)

Num: (-9, ..., 10) — (.05, ..., .05)

BEx: (+, -, *) — (.3, .3, .4)

(defm gen-e []

Anglican's defn.

Anglican functions defined outside of a query.

Ex: (Num, x, BinEx) — (.4, .4, .2)

Num: (-9, ..., 10) — (.05, ..., .05)

BEx: (+, -, *) — (.3, .3, .4)

Ex: (Num, x, BinEx) — (.4, .4, .2)

Num: (-9, ..., 10) — (.05, ..., .05)

BEx: (+, -, *) — (.3, .3, .4)

```
Ex: (Num, x, BinEx) — (.4, .4, .2)
Num: (-9, ..., 10) — (.05, ..., .05)
BEx: (+, -, *) — (.3, .3, .4)
```

[Q] Complete this Anglican program.

Solve program induction via generative modelling

- I. Create a simulator.
 - Generate expressions using probabilistic grammar.
- 2. Specify success criteria with conditioning.
 - High likelihood if the evaluation of a sampled expression matches data well.
- 3. Solve the problem by posterior inference.

```
(defm gen-e [] . . . .)
  (defquery grammar []
    (let [prog (list 'fn ['x] (gen-e))]
      prog))
```

```
(defm gen-e [] . . . .)
  (defquery grammar [ints outs]
    (let [prog (list 'fn ['x] (gen-e))]
```

prog))

```
(defm gen-e [] . . . .)
(defn evaluate [f-code v] ((eval f-code) v))
(with-primitive-procedures [evaluate]
  (defquery grammar [ints outs]
      (let [prog (list 'fn ['x] (gen-e))]
```

prog)))

```
(defm gen-e [] . . . .)
(defn evaluate [f-code v] ((eval f-code) v))
(with-primitive-procedures [evaluate]
  (defquery grammar [ints outs]
    (let [prog (list 'fn ['x] (gen-e))
          f (fn [in out]
              (observe
                out))]
      (map f ins outs)
      prog)))
```

[Q] Complete this.

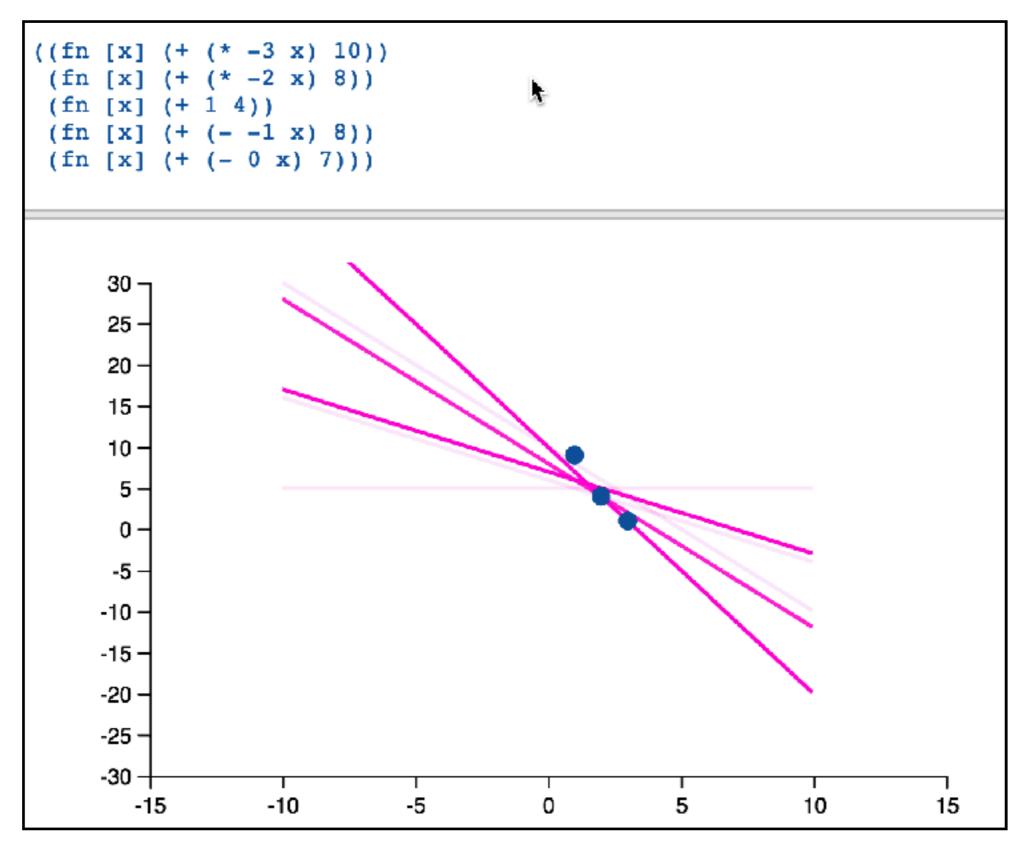

```
(defm gen-e [] . . . .)
(defn evaluate [f-code v] ((eval f-code) v))
(with-primitive-procedures [evaluate]
  (defquery grammar [ints outs]
    (let [prog (list 'fn ['x] (gen-e))
          f (fn [in out]
              (observe
                (normal (evaluate prog in) 1)
                out))]
      (map f ins outs)
      prog)))
```

[Q] Complete this.

```

Summary

- The generative approach suggests to specify a process for generating hypothesis & data.
- This process clarifies hidden assumptions.
- Goes well with probabilistic programming.
- Prob. PLs let us use powerful programming constructs (eval, etc) in modelling.

Information

 I will put gorilla worksheets for 2d physics and program induction in the webpage.
